EXPERIMENT

Title

SUM OF NUMBERS AT PRIME FACTORS

Description

Prime factors of a positive integer are the prime numbers that divide that integer exactly.

Given an array arr of n integers and a positive integer num.

Let's suppose prime factorization of num is: $p^a \times q^b \times r^c \times \dots \times z^f$, where p,q,r...z are prime numbers.

Sum of numbers in array arr at indices of prime factors of number num is: $a \times arr[p] + b \times arr[q] + c \times arr[r] + \dots + f \times arr[z]$.

You are given an array arr of size n and a positive integer num. You are required to calculate the sum of numbers in arr as mentioned above, and print the same.

Note:

- If arr is empty, print -1.
- If prime factor of num not found as indices, print 0.

Input Format:

The input consists of three lines:

- The first line contains an integer, i.e. n.
- The second line contains an array arr of length of n.
- The third line contains an integer num

The input will be read from the STDIN by the candidates.

Output Format:

Print the sum that was mentioned in the problem statement.

Example:

Input:

6

11 21 32 45 1 23

6

Output:

77

Explanation:

$6 = 2^1 \times 3^1$

$sum = 1 \times arr[2] + 1 \times arr[3] = 1 \times 32 + 1 \times 45 = 77$

Source Code:

```
import math
def is Prime(n):
    for i in range(2,int(math.sqrt(n))):
        if n%i==0:
            return False
    return True
N=int(input())
A=list(map(int,input().strip().split))
P=int(input())
nums0=dict()
for i in range(2,P+1):

    while isPrime(i)and P%i==0:
        numsP[i]+=1
    else:
        numsP[i]=1
    P=P//i
answer=0
for key, value in numsP.items():
    if key
```
